

Fold a paper as shown in the figure and draw lines on it. Fix a pin at the centre and keep the chart on it in such a way that the lines on the paper and circular chart matches. As the chart is rotated the pictures in each quadrant is also rotated. Now we can see the pictures are moving as the chart is rotated on the paper.

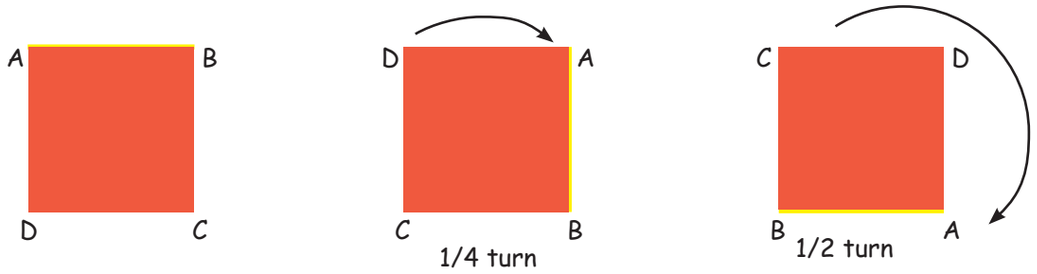

Movement about a fixed point is called rotation. The point o where the pin is fixed is called centre of rotation. We can observe the movement of pictures after every rotation. After one complete rotation, the chart comes back to the starting position.

From this we understand that,

When the round chart is rotated about the centre point the images are rotated accordingly. The point is called as "centre of Rotation".

Example

Observe the rotation of the square.
